John R. Moroney

Power Struggle: World Energy in the Twenty-First Century John R. Moroney

Can catastrophic climate change in this century be averted without strangling the world economy and global aspirations for improved living standards? Both of which depend on the continuing prominence of fossil fuels in the 21st century? *Power Struggle: World Energy in the Twenty-First Century* argues that it can. Moroney demonstrates that energy is the cornerstone of world civilization and global economic growth by measuring the tight coupling between energy per capita and real standards of living. Fossil fuels—oil, natural gas, and coal—today account for 88 percent of world energy. The author shows that renewable energies such as solar, wind, ethanol, and biodiesel cannot be deployed to replace fossil fuels on a globally significant scale within the next 50 years. Fossil fuels, he maintains, will continue to dominate world energy for the next half-century, in spite of the coming severe depletion of world reserves of conventional oil and gas.

But since the burning of fossil fuels is the principal source of carbon dioxide emissions, which are in turn the principal source of global warming, how can catastrophic climate change be avoided? The solution to the dilemma, says Moroney, is to capture and permanently store most of the carbon dioxide emitted by the human race. Half of all human CO₂ emissions originate in 8,000 electric power plants, refineries, steel mills, and other manufacturing facilities around the world. The technology is at hand to capture the CO₂ emissions from these big plants and store them, permanently and harmlessly, in geological traps and the deep ocean, instead of releasing them into the atmosphere. Coal-fired power plants with near-total capture of CO₂ emissions will become operational in the United States and Western Europe as early as 2012. If the world is to thread the perilous straits of economic and climate catastrophe, international cooperation and capital investment on a scale unprecedented in human history will be required. *Power Struggle* marshals the most important facts concerning world energy reserves: where oil, natural gas, and coal, and uranium reserves are located; how long they will last at projected rates of consumption; and why the most prosperous countries of the world will increasingly rely on oil and natural gas imports from the Middle East and Russia. Moroney shows why it is reasonable to expect that unconventional oil and gas sources such as heavy crude oil, tar sands, and oil shale will come on stream as feasible long-term substitutes for the world's depleted reserves of conventional oil and gas.
